

DataCaddie Page Overviews

Cheat Sheet

The Cheat Sheet provides a complete, at-a-glance view of the entire tournament field. It combines:

- Player Salaries (FanDuel and DraftKings)
- Recent performance
- Course History
- Strokes Gained Metrics
- PGA Tour season-long statistics

All of this is presented in a single sortable table, making it an ideal starting point for building DFS lineups.

Columns

Player Info

- Player Name
- FD Salary - FanDuel Salary
- Dk Salary - DraftKings Salary

Last N Rounds - Strokes Gained

These values reflect a player's average Strokes Gained over their most recent N rounds, where N is controlled by the SG Round Sample input.

- SG: {Putt, ARG, APP, OTT, T2G, TOT}
- numRds: Number of rounds available for calculation (some players have fewer than N rounds in the database)

PGA TOUR Statistics (Season-long)

These come directly from PGATOUR.com and reflect full-season performance:

- SG: {Putt, Arg, App, Ott, T2G, Tot} PGA
- Dr. Dist - Driving Distance
- Dr. Acc - Driving Accuracy
- GIR% - Green in Regulation Percentage
- SandSave%
- Scrambling
- App. {50-75, 75-100, 100-125, 125-150, 150-175, 175-200, 200_up}: (Average distance from the hole after approach shots from these ranges - lower is better)
- BOB% - Birdie or Better Percentage

- Bog. Avd - Bogey Avoidance
- Par {3, 4, 5} Scoring
- Proximity
- Rough Proximity
- Putt BOB%
- 3 Putt Avd
- Bonus Putt

Recent History:

Finishing positions in the player's most recent 10 PGA Tour Events

- Rec {1 - 10}

Course History:

Finishing positions in the most recent 5 events at this course

- -{1-5}

Controls

- **Choose Stats to Display:** A multi-select dropdown that lets you show or hide columns. Some stats (like driving distance or driving accuracy) are optional and must be selected here to appear
- **SG Round Sample:** Controls how many recent rounds are used when calculating "Last N" Strokes Gained.
- **Color Mode:**
 - Gradient: Red = worst, Blue = Best
 - Flags: Red -> Orange -> Yellow -> Green
- **Search:** Filters the table based on any value or player name.

Golfer Profiles

This page provides a deep dive into one golfer at a time, showing how their skills, form, and results compare to the rest of the field. It is split into three panels.

Left Panel

- Player selection dropdown
- FanDuel and DraftKings salaries
- **Radar Chart:**
 - Blue = selected golfer

- Red = field average
- Points farther from center represent better values for a given statistic

Middle Panel

Summary Tab

Expandable categories:

- Off-the-Tee
- Approach
- Around the Green
- Putting
- Scoring

Each stat shows:

- Stat name
- Player Value
- Player percentile in the field

Category Tabs (OTT, APP, ARG, PUTT, SCORING)

Each tab displays bar plots for every stat in that category.

- The center tick mark = field average
- Bars extending right and blue = better than field
- Bars extending left and red = worse than field

Longer bars mean stronger deviation from the field average

Right Panel

The Recent History table shows:

- Tournament finish
- Event-level Strokes Gained

Expanding rows reveals round-by-round SG.

The search box can filter by any value.

Course Overview

This is one of the most powerful tools on the site. It helps answer:

What type of golfer tends to succeed at this course?

Each week, the current tournament course loads by default, but you can select any course in the database.

Left Panel - Course Statistics

This table shows how the course plays across many categories:

- Overview (par, yardage, etc.)
- Scoring
- Off-the-Tee
- Approach
- Around the Green
- Putting

Each row includes:

- Stat name
- Course value
- Percentile among all courses

Important Notes:

- 1) Blue vs. red indicates high vs. low, not good vs. bad. For example, Augusta being dark blue in 'Score to Par' means it is very difficult.
- 2) Many stats are advanced - feel free to ask how they are calculated.
- 3) You can view all years combined or a specific year using the Year dropdown.

Middle Panel - Course Fit Visualizations

Three different models show how the course plays

1) Basic Stats

This answers:

Which player skills matter most at this course?

A model identifies which basic stats most correlate to success here. The 'Radar Plot' describes how important each statistic is relative to its importance at the average course.

- Blue = this course
- Red = average course

If a blue point is farther from the center than red for a statistic, then that stat is more important on this course than usual.

Below the radar chart is a list of the 10 most similar courses based on these requirements.

This same model is used for the 'Projected Course Fit' table on the right.

2) Course Attributes

This compares:

- Course length
- Fairway Width
- Missed-fairway penalty
- Scoring Difficulty
- Shot-type Difficulty

Three shapes appear on the 'Radar Plot':

- Blue = features of this course
- Red = features of the average course
- Green = average of the most similar courses to this course (the "course cluster")

This helps you understand how the course compares to both the Tour average and its closest peers.

3) OTT Strategy

This focuses specifically on course tee-shot demands, including:

- Fairway width
- Miss penalty
- Driving distance and accuracy
- Par 4 and Par 5 average lengths

Again, for the 'Radar Plot':

- Blue = this course
- Green = similar courses
- Red = average course

This helps identify what sorts of off-the-tee players this course favors, from bombers, to accuracy players, or some blend of both.

Right Panel - Player vs. Course Tables

These tables connect players to the course:

- **Course History:** How players have performed at this course
- **Projected Course Fit:** Model-based ranking of how well each golfer's skillset fits this course
- **Similar Course Performance:** Player performances on courses with similar attributes
- **OTT Course Performance:** How players have performed off the tee (and overall) on similar driving-demand courses
- **Scoring History:** Course-specific player scoring averages

Each table includes an in-site **INFO** button with additional detail.

Custom Model

This page lets you build your own player-ranking system.

How it works:

- 1) Select stats in which you wish to use to rank players in the 'Choose Model Stats' dropdown
- 2) Assign a weight to each stat (larger number = more important to rating, smaller = less).
Many users sum weights to 100 for each interpretation
- 3) Click Submit

Players are ranked using a **weighted average** of your selected stats.

Model Output

The results table includes:

- Player name and Salary
- **Rating**: How strong the player is for your selected stats
- **Value**: Rating adjusted for salary
- All chosen stat values

You can:

- Sort by **Rating** to see the best pure players rated
- Sort by **Value** to find underpriced players based on these stats

Lineup Generator

After creating a model, click **Generate** to open a feature that enables building optimal lineups based on your created rating system.

Settings:

- **Num Lineups**: How many lineups to create
- **Locked Players**: Multi-select dropdown of players that must appear in every lineup
- **Player Pool**: Multi-select dropdown of players eligible to appear in lineups. To exclude a player, remove their selection in this dropdown

Click **Generate Lineups** to build optimal DFS lineups using your model.

Multi-Filter Tool

This tool filters performance by:

- Course difficulty
- Field strength

and more to come.

You can view different statistical perspectives of players performance in selected conditions by changing the **Stat View**. Detailed explanations of the tool overall and the views are available inside the tool via the **INFO** buttons.

Favorites

This page lists all players you have 'starred' on the site - perfect for building and tracking your DFS player pool.
